Milestone 1 Project — Web Foundation

Full Stack + AI Engineering Program

Overview

Item	Detail
Build Window	2 weeks from brief release (alongside classes)
Delivery + Presentation	Date announced later by the team
Mode	Individual
Submission	Live Vercel URL + Public GitHub repo + README
Presentation	7 min demo + 3 min Q&A

Purpose: Prove you can independently convert an idea into a responsive, accessible, version-controlled, deployed website — using everything from Weeks 1–4. This is not a class-guided build. Your domain must be different from all class projects (no personal portfolio, no landing page clone, no recipe UI).

Choose ONE Project Option

All three options carry the same technical requirements and the same rubric. Pick the one that excites you — you will present and defend it.

Option A — Local Business Website

Build the complete website for a real (or realistic) Jaipur business: café, gym, salon, coaching center, cloud kitchen, boutique, dental clinic.

Required pages (4+): 1. Home — hero, highlights, testimonials 2. Services / Menu — card-based layout (CSS Grid) 3. Gallery — responsive image grid 4. Contact — accessible form (name, phone, message, service dropdown) + address + map embed

Domain-specific must-haves: - Pricing table or service cards - “Why choose us” section using Flexbox - Business hours + call-to-action buttons

Best for: learners who want a portfolio piece they can literally pitch to a real shop owner.

Option B — Event / Fest Microsite

Build the official site for an event: college tech fest, wedding, music night, marathon, startup meetup, food festival.

Required pages (4+): 1. Home — hero with event date, venue, countdown-style highlight strip (static is fine) 2. Schedule / Lineup — timeline or day-wise grid 3. Speakers / Performers / Highlights — card grid with photos 4. Register — accessible registration form (name, email, ticket type radio buttons, T&C checkbox)

Domain-specific must-haves: - Ticket/pass pricing tiers (3-column Grid section) - Venue section with embedded map - Sponsors/partners logo strip (Flexbox wrap)

Best for: learners who enjoy bold, visual, poster-style design.

Option C — Cause / Community Website

Build a website for an NGO, social cause, or community initiative: animal shelter, blood donation drive, tree plantation, skill-training NGO, heritage conservation.

Required pages (4+): 1. Home — mission hero, impact stats strip (numbers in Flexbox row) 2. Programs / Work — what the organization does, card layout 3. Stories / Gallery — image grid + short impact stories 4. Get Involved — accessible volunteer/donation-interest form

Domain-specific must-haves: - Impact numbers section (e.g., “5,000+ meals served”) - Team or volunteers section - Clear donate / volunteer call-to-action on every page

Best for: learners motivated by storytelling and purpose-driven design.

WSCUBE TECH® Upskilling Bharat

Technical Requirements (ALL options — non-negotiable)

HTML

- [ ] Semantic tags throughout (header, nav, main, section, article, footer)
- [ ] One fully accessible form: label linked to every input, correct input types, required where sensible
- [ ] Meaningful alt text on all images
- [ ] Proper heading hierarchy (one h1 per page)

CSS

- [ ] Both **Flexbox** and **CSS Grid** used meaningfully (at least one major section each)
- [ ] Consistent typography system (max 2 font families) and color palette
- [ ] Hover/focus states on all interactive elements
- [ ] No inline styles

Responsive Design

- [ ] Mobile-first approach
- [ ] Works at 3 breakpoints: mobile (~375px), tablet (~768px), desktop (~1280px)
- [ ] No horizontal scroll at any width; images scale properly

Tailwind CSS

- [ ] Entire site styled with Tailwind utilities (custom CSS only where justified)
- [ ] **Dark mode toggle or** prefers-color-scheme **support**

Git & GitHub

- [ ] Minimum **10 meaningful commits** with clear messages (no “final final2 update”)
- [ ] Minimum **2 branches** (e.g., main + feature/contact-page)
- [ ] At least **1 merged Pull Request**
- [ ] README.md: project description, pages list, tech used, live link, screenshots

Deployment

- [ ] Live on **Vercel** (or Netlify) — link works on mobile data, not just localhost
- [ ] All images/assets load on the deployed site

Presentation Day (7 + 3 min)

Your 7 minutes: 1. **30 sec** — What you built and why you chose this option 2. **3 min** — Live walkthrough on **desktop**, then resize/show **mobile** view live 3. **2 min** — Show one layout decision: open the code, explain where you used Grid vs Flexbox and why 4. **1 min** — Show your GitHub: commit history, branches, merged PR 5. **30 sec** — One thing that was hard + how you solved it

Trainer Q&A (3 min) — expect questions like: - “Why is this section Grid and not Flexbox?” - “What happens to this layout at 320px?” - “Why did you use a section here instead of a div?” - “Show me the commit where you built the form.”

You are graded on **understanding**, not memorized answers.

Grading Rubric (100 marks)

Criteria	Marks	What we check
Requirements coverage	40	Every checklist item above
Code quality & structure	20	Clean HTML, sensible class usage, file organization
Git hygiene + deployment	15	Commits, branches, PR, working live link
Presentation & Q&A	15	Clarity, live demo confidence, answers show understanding
Polish & UX	10	Visual consistency, spacing, typography, dark mode quality

Scores are shared as feedback to help you see exactly where to improve — top scorers get featured on the batch showcase.

Rules

1. **Individual work.** Discuss ideas freely; write your own code.
2. **AI tools:** allowed for learning/debugging, but you must be able to explain every line in Q&A. If you can't explain it, it counts against you.
3. **No templates or theme clones.** Design references are fine; copied code is not.
4. **Submit within your 2-week window.** Incomplete but deployed beats complete but local.

Submission Format

Submit within the 2-week build window via the batch form/WhatsApp group:

```
Name:
Batch:
Option chosen: A / B / C
Live URL:
GitHub URL:
```

Build something you'd proudly show a recruiter. This is the first project on your public GitHub — make it count.
